Supplementary Fig. 1. Distribution of cell subsets among PBMCs in 5-6 month old female and male 3xTg-AD versus WT mice. Blood mononuclear cells isolated from individual WT and 3xTg-AD mice were stained for T cells, B cells, macrophages, dendritic cells and granulocytes as well as for expression of CCR6 and Ly6C markers. Data are presented as mean ± SD with n = 8-9 mice/group.
Supplementary Fig. 2. Changes in cytokine levels in activated PBMC from 5-6 month old WT and 3xTg-AD female and male mice. PBMC from WT and 3xTg-AD mice were cultured in the presence of plate-bound anti-CD3 (5 µg) and anti-CD28 (1 µg) mAb for 24 h and supernatants were assayed for cytokine levels by Luminex assay as described in Materials and Methods. Note increases in IL-6 and IFN-γ levels and a decrease in IL-2 levels in young 3xTg-AD females but not males compared to WT controls. Data are presented as mean ± SD with n = 7–8 mice/group. ND = not detectable.
