Supplementary Figure 1. Detection of tau proteins in human saliva with Western blotting. Proteins from pooled control saliva were precipitated with 20% trichloroacetic acid, washed with cold acetone and dissolved with a urea/loading buffer (8 M urea, 2% sodium dodecyl sulphate [SDS], 10% glycerol, 62.5 mM Tris, pH 6.8). Protein concentrations were measured using a BCA protein assay kit (Pierce). 50 μg of proteins from saliva and 20 μg of proteins extracted from human brain (cerebral cortex) were loaded onto SDS-PAGE and transferred to a PVDF membrane. The membrane was immunoblotted with the biotinylated detection antibody from the INNO-BIA AlzBio3 Luminex kit (Innogenetics) for overnight at 4 °C followed by horseradish peroxidase-conjugated avidin for 1 h at room temperature.
