Supplementary Figure 1. Proteasome inhibition decreases viability measured as MTT reduction capacity. MTT assay was performed on SH-SY5Y AβPPswe cells after exposure to 0.5 μM MG-115, with or without 1 mM 3-methyl adenine (3MA). Cellular viability was decreased by proteasome inhibition, which could be prevented by co-treatment with 3MA. Bars represent mean ± SD, n = 5, *p < 0.05, **p < 0.01.
